# Linux VPS Cold Wallet v2.0.0.0 update Guide

**Masternode Cold Wallet**

Cubex Cold Wallet Masternode - The Masternode runs on another computer (VPS), while coins are stored locally in your wallet. It is a more secure approach, as the public IP address associated with the Masternode is not the same as the wallet IP address. In addition, shut down of the wallet does not affect the Masternode.

**Prerequisites**

If you already have used script-install for v1.0.0.0 then this update guide is for you:

**Note: For a first time installation use this guide:  [https://github.com/cubex-network/Guides/blob/master/linux-masternode-cold-wallet-guide_cubex.pdf](https://github.com/cubex-network/Guides/blob/master/linux-masternode-cold-wallet-guide_cubex.pdf)**

1. **Masternode Update installation**

   Login to your VPS with Putty.

   Installation:

   git clone https://github.com/cubex-network/cubex-install-script.git
   cd cubex-install-script
   bash update_script-v2.0.0.0.sh

All is good! Congrats for update to v2.0.0.0
